```
    public void getPrice() {

    }

    public void getFat() {

    }

    public void getCarbs() {

    }

    public void getFiber() {

    }
```

The mistake is that Food class, I removed the getPrice(), getFat(), getCarbs(), and getFiber() methods i didn't need the public voids , this mistake causes my code class no longer access the values of price, fat, carbs, and fiber from Food objects.

```
public double getPrice() {
    return price;
}

public int getFat() {
    return fat;
}

public int getCarbs() {
    return carbs;
}

public int getFiber() {
    return fiber;
}
```

So having methodes i allowed the code to access the values of price and fat and carbs so the code can use the values.
